

## FOBRO Star

REVERSIBLE CAST  
IRON STARS

SIMPLE ADJUSTMENT  
OF ROW SPACING

MECHANICAL ADJUSTMENT OF  
THE WORKING DEPTH

The FOBRO Star can be used all year round. To ensure there are no stoppages during operation, the star discs are arranged in two rows. The discs are approximately 2 cm in width. The teeth are arranged on the discs in a sickle shape. On the one hand, this guarantees good penetration into the soil even under difficult dry conditions. On the other hand, this tooth flank surface has a tearing action which is better for bringing the weeds to the surface of the soil. If required, a following harrow can also be mounted behind the discs.

<b>Range of application</b>	For processing all row or cereal crops on any soil quality. The device is very effective when used for the mechanical control of weeds and for levelling out post-harvest residues in the topsoil.
<b>Can be used all year round</b>	Soil preparation before sowing, loosening the soil after sowing, preventing delays in seed growth, increasing soil porosity.
<b>Working height</b>	With standard row spacing the device operates from the second leaf up to 20 cm plant height. However if the row spacing is increased, crop processing at a height of 60 cm is possible.
<b>Manure spreading</b>	The FOBRO Star can be equipped with the FOBRO Linus to spread liquid fertiliser.
<b>Universal frame</b>	The universal frame makes it possible for the device to be fitted with a variety of tools.
<b>Optional: Following harrow</b>	The following harrow pulls the weeds to the surface so that they can dry out.

Technical data:

FOBRO Star			
Working width	300 cm	440 cm	640 cm
Transportation width	300cm	440cm	300cm
Lever quantity	17	25	36
Lever quantity	34	50	72
Power consumption (HP)	from 90	from 90	from 110
Weight	900 kg	1250 kg	1800 kg

2016-01 Subject to technical changes and product improvements.
